

Powercor Armour Rod & Damper Retrofit

Customer: **Powercor Australia**

Country: **Australia**

Site: **Western Victoria**

PROJECT DESCRIPTION

The contract initially involved retrofitting of additional line hardware at more than 150,000 locations over a 3 year contract term. Within this initial term Omexom-Electrix successfully completed almost 170,000 sites. The contract was further extended until December 2016 to cover a total of 190,000 sites. The work was undertaken on overhead power lines within High Bushfire Risk Areas across the Powercor rural network with the majority of work undertaken under "live line" conditions to minimise network outages.

Omexom-Electrix also worked closely with PNS to identify opportunities to undertake additional maintenance activities on associated assets on a "one site visit" methodology which provides further network operational benefits.
